

ikarmic AI

Agentic Operating System — AIOS

Hire AI employees. Keep humans in control. Own your workforce.

ikarmic AI is a self-hosted, white-label platform that lets any company deploy role-based AI employees — not chatbots, but AI staff that work alongside your human team with defined roles, skills, and governance controls. Give them goals, review and approve their actions, and watch your operational capacity multiply without losing control.

Every action is governed. Every decision is audited. Every email is approved by a human before it goes out. You own the code, the data, and the brand — no vendor lock-in, no per-seat fees.

ARIA	AI SDR	Sales Development
RIO	AI Recruiter	Talent Acquisition
OTTO	AI Ops	Operations Coordination

What is ikarmic AI?

ikarmic AI is an Agentic Operating System — a reusable platform where AI employees are not hardcoded bots but pure configuration. Each AI employee has a defined role, persona, set of skills, KPIs, and permissions. When you give one a goal, a built-in orchestrator decomposes it into subtasks, delegates to the right skills, and passes every action through a governance gate before execution.

Think of it as hiring staff — but for the repetitive, high-volume operational work that consumes your human team. Sales outreach. Candidate sourcing. Task tracking. Status reporting. Your AI employees handle the grind while your people focus on decisions, relationships, and strategy.

How It Works

- Set a goal — Type what you need done and pick an AI employee.
- Orchestration — The CEO agent decomposes the goal and delegates subtasks.
- Execution — The AI employee picks the right skills and begins working.
- Governance gate — Every action checks permissions, confidence, and approval rules.
- Human approval — Sensitive actions (like sending email) pause for you to review.
- Audit trail — Everything is logged. Nothing is hidden.

The same platform runs sales, recruitment, and operations today. Adding a new department — support, finance, legal — requires only new role definitions and skills, not new infrastructure or agent code.

Pain Areas We Address

Repetitive Operational Work

Your team spends hours on lead sourcing, candidate screening, task tracking, and status reporting. ikarmic AI employees handle this high-volume grind around the clock, freeing your people for high-judgment work.

Inconsistent Outreach & Follow-up

Missed follow-ups cost revenue. The AI SDR follows structured playbooks, never drops a follow-up, and maintains CRM hygiene automatically — every lead gets the attention it deserves.

Slow Hiring Pipelines

Recruiters drown in sourcing and screening. The AI Recruiter sources candidates, screens resumes against your job requirements, and schedules interviews continuously — dramatically reducing time-to-hire.

Lack of Operational Visibility

Projects stall without anyone noticing. The AI Ops Coordinator continuously monitors tasks, flags delays the moment they arise, and provides clear status summaries — nothing falls through the cracks.

Fear of Unsupervised AI

Enterprises cannot risk AI sending emails or updating systems without oversight. ikarmic AI's governance gate requires human approval for sensitive actions, uses single-use approval tokens, and maintains an immutable audit trail for every decision.

Vendor Lock-in

SaaS AI platforms mean you don't own your data or your instance. ikarmic AI is self-hosted source code — you own everything. No per-seat pricing. No vendor dependency. No data leaving your infrastructure.

Disconnected Tools

Your team toggles between CRM, email, calendar, ATS, and project tools. ikarmic AI connects to all of them — HubSpot, Gmail, Google Calendar, Greenhouse, Linear — so your AI employees work with your real systems, not a walled garden.

Meet Your AI Employees

ARIA

AI Sales Development Representative

Aria is your always-on sales assistant. She finds and qualifies leads, drafts personalized outreach, books meetings on your calendar, and keeps your CRM up to date. Aria never sends an email without your approval — every outbound message pauses in the approval inbox for a human to review before it goes out.

Skills: Find leads · Qualify leads · Draft personalized outreach · Send email (approval-gated) · Book meetings · Update CRM · Schedule follow-ups · Log all activity

RIO

AI Recruiter — Talent Acquisition

Rio accelerates your hiring pipeline. He sources candidates across platforms, screens resumes against your job requirements, schedules interviews on your calendar, and updates your applicant tracking system. Rio reuses outreach and communication skills from Aria — showing the platform's reuse-first design.

Skills: Source candidates · Screen resumes · Schedule interviews · Update ATS · Draft outreach · Send email (approval-gated) · Schedule follow-ups · Log activity

OTTO

AI Operations Coordinator

Otto is your internal operations watchdog. He tracks all tasks and projects, flags delays or blockers the moment they arise, assigns work to team members, and produces clear status summaries so you always know where things stand. Otto leverages shared communication skills to keep stakeholders informed.

Skills: List project tasks · Flag delays · Assign tasks · Summarize status · Send email · Schedule follow-ups · Log activity

All three run on the same platform. Adding a fourth employee — like an AI Support Agent or AI Finance Assistant — requires only defining a new role and a few new skills. No new agent code, no new infrastructure, no additional deployment.

Platform Features

Governance & Trust

ikarmic AI's governance system is designed for enterprises that need AI to be productive and trustworthy. Every action an AI employee takes passes through a gate that checks permissions, confidence levels, and approval rules.

- Human-in-the-loop approvals — Sensitive actions pause in a web approval inbox. You see exactly what will happen before it happens.
- Single-use approval tokens — Approvals cannot be reused or repurposed for different actions.
- Role-based access control — Each AI employee has defined scopes restricting what they can access.
- Confidence scoring — Low-confidence actions are escalated for human review, not executed blindly.
- Immutable audit log — Every decision, every skill call, every approval is permanently recorded.
- Rate limiting & daily budgets — Per-tenant caps prevent runaway costs.
- CAN-SPAM compliance — Built-in opt-out management and unsubscribe enforcement.

Integrations

ikarmic AI connects to your existing tools so your AI employees work with your real systems. All credentials are encrypted at rest. Live validation ensures integrations work correctly.

HubSpot	CRM — OAuth2
Google Calendar	Scheduling — OAuth2
Gmail / SendGrid	Email delivery — OAuth2 / API Key
Greenhouse	Applicant Tracking — API Key
Linear	Project Management — API Key

Extensible tool model — Adding Salesforce, Slack, Stripe, Jira, or any other tool requires only adding an OAuth or API-key adapter. No platform changes needed.

Skill Marketplace

New capabilities can be created without writing code. The marketplace lets your team browse, publish, and install skills across your organization.

- Prompt Skills — Define a system prompt, template, and input fields. No code required.
- Workflow Skills — Compose multi-step automations by chaining existing skills together.
- Code Skills — Python-powered skills that ship in the box.
- Install-gated access — AI employees can only use marketplace skills your tenant has installed.

Ownership & White Label

You Own Everything

ikarmic AI is delivered as self-hosted source code, not a SaaS subscription. You run it on your own infrastructure with your own database. Your data never leaves your control. No vendor has access to your instance, your data, or your operations.

- Single-command deployment — Docker Compose. One command, and your AI workforce is running.
- Bring your own database — Any PostgreSQL-compatible database (plain Postgres, Neon, Supabase, cloud-managed).
- Offline license keys — Cryptographic Ed25519 keys validate your deployment without phoning home.
- No per-seat pricing — One license, unlimited AI employees, unlimited actions. No surprise bills.
- Self-contained authentication — Built-in JWT auth with refresh tokens, password reset, and email verification. No external identity provider needed.

Your Brand, Your Identity

The entire platform is white-label ready. Customize the company name, logo, colors, and email sender identity. Your team and your customers see your brand, not ours. Branding is managed through configuration — no source code modifications required.

Enterprise-Grade Security

- Encryption at rest — All integration credentials, tokens, and sensitive configuration are encrypted before storage.
- JWT with refresh rotation — Secure session management with automatic token refresh.
- Login throttling — Brute-force protection on authentication endpoints.
- RBAC for human users — Admin, member, and owner roles control who can manage AI employees, integrations, and team members.
- Immutable audit trail — Append-only logs. Every action is permanently recorded and searchable.

What's on the Roadmap

- AI Support Agent — Inbox triage, knowledge-base-grounded replies, ticket escalation.
- AI Finance Assistant — Invoice drafts, expense categorization, reconciliation.
- Knowledge Base (RAG) — Upload company documents and have employees answer from them.
- Autonomous Triggers — Cron schedules and webhook triggers so AI employees run on their own.
- ROI Scorecards — Per-role cost accounting and outcome metrics.
- Multi-channel Approvals — Approve actions from Slack, email, or SMS.
- Visual Workflow Builder — Drag-and-drop canvas for composing multi-step automations.

ikarmic AI is an AI workforce that works for you, on your terms, under your control.

Self-hosted. White-label. Enterprise-governed.
